

AI-Designed Portrait Guide #008

Difficulty Advanced Est. time 10-14 hours Subject Portrait / Figure Pencils Prismacolor Premier

Every guide in this series is generated by Claude — an AI trained on professional art instruction, anatomy theory, color science, and fine arts critique frameworks. It analyzes the reference, identifies the technical challenges, and writes a sequenced plan before I touch a pencil.

Then I follow it exactly and document what happens — so the results are verifiable, not theoretical.

At the end of each guide, there's a prompt you can run on your own work to get the same level of critique.

PENCIL & PROMPT

• COLOR PALETTE

Beige Sienna

PC1080

Primary warm base skin tone; mid-value foundation establishing temperature and saturation

Light Peach

PC927

Light area mid-tone; warm highlight transition and cheek luminosity base

Peach

PC939

General skin mid-tone for building dimension and warmth in midtone zones

Nectar

PC1092

Warm chromatic shadow undertone; optical mixing with cooler shadows creates depth without deadening

Henna

PC1031

Warm brown shadow definition; establishes form shadow edges and structural contours

Mulberry

PC995

Cool complementary shadow for deepest recesses; creates visual temperature contrast in eye sockets

Greyed Lavender

PC1026

Cool subtle shadow undertone; reflected ambient light carrier and transition color

Chestnut

PC1081

Deep warm shadow for final depth; defines darkest structural shadows and eye definition

White

PC938

Final highlight burnishing and specular gleam; applied with heavy pressure only on brightest catchlights

Powder Blue

PC1087

Reflected ambient light from above; introduces cool undertone in light zones and eye whites

Deco Peach

PC1013

Warm transparent glaze layer for unifying skin tone and softening transitions

Peach Beige

PC1085

Light transition color bridging highlights and mid-tones; optical mixing for glow effect

Jasmine

PC1012

Yellow undertone warmth carrier; adds luminosity to light areas and transitions

Sunburst Yellow

PC917

Warm glow foundation in light zones; optical mixing with peaches creates dimensional warmth

10% Warm Grey

PC1050

Subtle midtone transition; introduces cool undertone without neutralizing warmth

Ginger Root

PC1084

Warm undertone variation for feature areas (lips, cheek contours); prevents monotony

SUBJECT IDENTIFICATION

<i>What is the subject?</i>	Frontal three-quarter portrait of a person with warm, olive-complexioned skin exhibiting soft, youthful features with refined bone structure. Face shows natural relaxation without extreme expression, emphasizing form over emotion.
<i>Material characteristics</i>	Smooth skin surface with minimal visible texture; light appears diffused rather than harsh, suggesting soft studio or window lighting. No visible blemishes or extreme weathering; skin shows translucency in light areas with subtle undertone complexity.
<i>Geometric structure</i>	Classic oval face structure with balanced proportions; symmetrical eyes set at equal height; prominent cheekbones creating mid-facial width; refined nose bridge with soft tip; lips of proportional fullness. Forehead shows gentle spherical form; jawline defined but not angular.

LIGHT & SHADOW ANALYSIS

<i>Light source direction</i>	Soft directional light from upper left and slightly forward; appears to be window light or diffused studio key light at approximately 45-degree angle, creating gentle modeling without harsh shadows.
-------------------------------	--

HIGHLIGHT

Brightest points on forehead center, nose bridge, upper cheekbones (below eye), and Cupid's bow of upper lip. These areas show pale warm cream coloration with hints of cool reflected light.

LIGHT AREA

Cheeks, lower nose, upper lip, chin center, and right side of forehead show full illumination with warm peachy-golden tones. Light wraps around form with soft transitions.

MIDTONE

Eyes, temples, lower cheeks, and central face show true local color—warm peachy-tan with full saturation. This zone comprises approximately 40% of facial surface and establishes dominant color statement.

SHADOW

Right side of face (viewer's perspective), eye sockets, under nose, under lower lip, and neck shadow show warm brown undertones mixed with cool lavender-mulberry suggestions. Shadows are transparent, not opaque.

CAST SHADOW

Subtle shadow beneath chin where face meets neck; minimal cast shadow on neck itself due to soft light quality. No extreme shadow separation.

<i>Edge quality notes</i>	Soft edge transitions dominate; very few hard edges except at eyeline and lip line. Hair-to-face boundary shows lost edges with warm glow. Jawline transitions gradually into neck with no sharp demarcation.
---------------------------	---

COLOR ANALYSIS

<i>Overall temperature</i>	Distinctly warm with olive undertone complexity; golden-peachy base temperature throughout, even in shadow areas. Temperature varies from light-zone golden-cream to shadow-zone warm-brown-with-cool-undertone.
<i>Light zone tendency</i>	Light areas lean yellow-peachy with subtle cool undertone from reflected sky or ambient cool light. Cheeks show saturated warm peachy-golden local color. Forehead and bridge show pale cream with yellow undertone.
<i>Shadow zone tendency</i>	Shadow areas show warm brown-henna undertone (opposite of cool purple approach) mixed with subtle cool mulberry-lavender for depth. Shadows remain warm-biased rather than cool-biased, maintaining overall warm temperature harmony.
<i>Special color areas</i>	Eyes show complex color beyond brown—subtle golden-olive undertone in iris with cool grey-blue undertone in whites. Lips show warm rose-brown undertone more saturated than surrounding skin. Cheeks exhibit warm peachy-pink flush distinct from general skin tone.
<i>Saturation distribution</i>	Highest saturation in cheeks (warm peachy-pink), lips (warm rose-brown), and iris centers. Mid-saturation in general skin tone (golden-tan-peach). Lowest saturation in shadows and upper eyelids where cooler undertones reduce chroma.

OI Value Structure & Light Mapping

Entire face and upper neck; establish tonal architecture before color application

Light directional parallel strokes following facial anatomy; pressure varies from barely-visible in highlights to medium in shadows; no blending

Light pressure

Using PC1050 10% Warm Grey with extremely light pressure, apply a transparent wash layer across entire face to establish value map. Create a structured light-to-dark gradient: brightest areas (forehead center, nose bridge, cheekbones) receive minimal pencil, while shadow zones (right face, eye sockets, under-nose) receive slightly heavier pressure. This creates a subtle grey undertone that establishes value relationships without committing to color. Apply with parallel strokes in the direction of facial form (following cheekbone planes, jawline curves). Do not blend yet; this is structural scaffolding that will be glazed over with chromatic color in subsequent steps. The grey acts as a neutral value reference allowing subsequent warm colors to read with maximum impact.

COLORS

PC1050 10% Warm Grey

✦ *This monochromatic value map prevents muddy color mixing later by establishing clear tonal relationships before introducing chromatic hues. Think of it as an invisible architectural blueprint that ensures your warm colors sit on correctly proportioned value foundation.*

O2 Warm Base Tone Foundation

Entire illuminated face area (forehead, cheeks, nose, chin, lips); exclude shadow zones temporarily

Circular motions following facial contours; medium pressure for controlled saturation buildup; multiple passes with slight overlap

Medium pressure

Apply PC1080 Beige Sienna as the primary skin tone across all light and mid-tone areas, using medium pressure in circular motions to ensure even coverage and smooth integration. Follow facial planes—apply slightly heavier in cheeks to establish warm local color base, lighter on forehead and nose bridge where highlights will emerge. Work around eyes and lips, leaving small white paper reserves in these feature zones. The Beige Sienna establishes warm undertone temperature and mid-value saturation foundation. Layer with moderate pressure in 2-3 passes, allowing slight paper texture to show through for dimension. This color acts as the unifying warm anchor that all subsequent warm glazes will reference. Do not attempt full opacity in single pass; build gradually to avoid wax bloom and maintain control.

COLORS

 PC1080 Beige Sienna

◆ *Beige Sienna is your chromatic anchor—its golden undertone sets the temperature ceiling for the entire portrait. Apply it before any shadows so your shadows can read as transparent glazes over this warm foundation rather than opaque darks on pale paper.*

03 Shadow Structure with Warm Chromatic Undertone

Right side of face, eye sockets, under-nose shadow, under-chin, and all shadow-receiving planes; establish form dimension

Form-following directional strokes; medium-heavy pressure in shadow cores transitioning to light pressure at shadow edges; no blending yet

Medium-Heavy pressure

Using PC1092 Nectar with medium-heavy pressure, block in shadow areas with directional strokes that follow the form (vertical strokes down cheek shadow, horizontal strokes under nose, curves around eye socket). Nectar's warm brown-orange undertone prevents shadows from appearing cool or muddy—it creates visual warmth even in recessed areas. Allow this color to transition gradually from mid-tone edges into darker core shadows; do not create hard lines. The warmth of Nectar optically mixes with the Beige Sienna foundation, creating dimensional depth through color temperature rather than mere value drop. This approach maintains portrait warmth while establishing convincing shadow form. Apply with pressure that allows underlying Beige Sienna to show through slightly, creating transparent depth.

COLORS

 PC1092 Nectar

♦ *Warm shadows (orange-brown undertone) read as more naturalistic skin shadow than cool purples for warm-complexioned subjects. This psychological color truth makes shadows appear transparent rather than painted, essential for photorealistic portraiture.*

04 Cool Shadow Depth & Complementary Darkening

Eyesockets, deepest shadow areas (right side of face below cheekbone, under chin), nostril interior; add dimensional depth

Heavy pressure in shadow cores only; careful placement to follow anatomical shadow placement; directional strokes reinforce form

Heavy pressure

Apply PC1031 Henna with heavy pressure into the deepest shadow recesses where form fold occurs (eye socket depth, shadow underneath cheekbone plane, nostril shadow, under-chin shadow). Henna's deeper warm brown value adds structural definition and creates the appearance of volume through shadow darkening. Layer over existing Nectar in the deepest zones only; this creates an optical mixing of warm brown shadows rather than transparent single-layer shadows. The Henna-over-Nectar combination reads as rich warm brown-shadow, creating form shadow that appears three-dimensional. Maintain directional pressure following form geometry. This layering builds shadow depth without introducing cool undertones that would flatten the warm temperature harmony.

COLORS

PC1031 Henna

◆ *Resist the temptation to layer cool purples and blues into deep shadows of warm skin—instead deepen existing warm shadows with darker warm browns. This preserves the chromatic harmony while creating convincing dimensional depth through value alone.*

05 Cool Undertone Introduction in Shadow Zones

Eyesocket interiors, deepest shadow folds, right face shadow edges; introduce cool undertone without eliminating warmth

Transparent glazing with light-medium pressure only in darkest shadow zones; carefully controlled application avoiding spread into mid-tones

Light-Medium pressure

Using PC995 Mulberry with medium pressure, carefully glaze over the deepest shadow areas (eye socket interiors, shadow folds at right cheekbone edge, under-chin shadow core) with thin transparent application. Mulberry's cool purple undertone optically mixes with warm Henna-Nectar layers beneath, creating visually rich brown-purple shadow that reads as three-dimensional without appearing artificial. This cool-over-warm approach creates chromatic complement mixing that the eye perceives as shadow depth rather than color contamination. Apply Mulberry as a transparent glaze only in darkest zones; do not extend into mid-shadows where warmth should dominate. The cool undertone in deep shadows creates atmospheric perspective—warm light advances, cool shadows recede—making the portrait read with convincing spatial depth.

COLORS

 PC995 Mulberry

◆ *Cool shadows only work in darkest value recesses of warm skin—in mid-shadows, cool colors flatten the form. This principle explains why subtle purple undertones in eye sockets feel right but purple in cheek shadows feels muddy.*

o6 Cool Reflected Light & Ambient Temperature

Shadow edges receiving reflected ambient light (right eye socket inner edge, right cheek shadow rim, under-chin shadow top edge); introduce atmospheric light

Transparent light pressure glazing on shadow edges only;
careful placement along light-shadow boundary transitions

Light pressure

Apply PC1026 Greyed Lavender with light pressure along the edges where shadow zones meet midtone areas, particularly where reflected light from the environment would naturally appear (inner eye socket rim, shadow edge along cheekbone, top edge of under-chin shadow). This cool lavender undertone suggests reflected cool light (from sky or environment) without overwhelming the warm local color. Layer Greyed Lavender transparently over existing shadow structure; it should read as a cool atmospheric undertone rather than a distinct new color. This technique mimics how real reflected light works—as a cool undertone in shadow edges, not a separate light source. The lavender-over-warm creates a vibrant optical mixture that reads as shadow with atmospheric depth. This introduces the cool temperature that balances the portrait's warm dominance.

COLORS

PC1026 Greyed Lavender

◆ *Reflected light works best as a thin undertone color at shadow edges rather than a distinct highlight—it should enhance shadow shape, not interrupt it. Think of it as cool temperature hint rather than visible light application.*

07 Light Area Warm Glow & Yellow Undertone

Forehead, nosebridge, cheeks, upper lip, chin center (all brightly lit areas); establish warm luminosity

Light pressure multiple passes following light direction; circular motions in cheeks, horizontal strokes on forehead; avoid visible yellow appearance

Light-Medium pressure

Apply PC917 Sunburst Yellow with light-medium pressure across all strongly illuminated areas, using it as a warm glow foundation before lighter peachy overlays. Work in the direction of light (horizontal strokes on forehead, downward strokes on cheeks). The Sunburst Yellow should read as a subtle warm undertone rather than visible yellow—apply with restraint, allowing underlying Beige Sienna to remain dominant. This golden undertone creates the optical effect of warm skin luminosity; where light is strongest, skin appears most golden-warm. Layer with 2-3 light passes rather than single heavy application. The yellow undertone will be glazed over with lighter peachy tones, but its warm vibration will show through, creating dimensional glow that appears to come from within the skin.

COLORS

 PC917 Sunburst Yellow

♦ *Sunburst Yellow creates the illusion of skin luminosity through optical mixing—it shouldn't appear as visible yellow but as a warm undertone making skin read as internally lit. This is the secret to photorealistic portrait glow.*

o8 Light Area Expansion with Peachy Mid-Light Tones

Cheeks, temples, lower forehead, upper lid area, upper lip; expand light zone with warm mid-light value

Circular motions on cheeks, light pressure multiple passes; follow underlying yellow undertone with transparent application

Medium pressure

Using PC927 Light Peach with medium pressure, apply across cheeks and expanded light areas to establish the luminous mid-light zone. Light Peach bridges the value gap between the deeper Beige Sienna base and the brightest highlights that will come later. Work in circular motions on cheeks to create soft, dimensional form; use slightly directional strokes on temples following the form plane. Layer with 2-3 passes, building gradually to achieve smooth transitions with underlying yellow undertone. The Light Peach creates warm peachy-cream appearance characteristic of illuminated skin. Where Light Peach overlays Sunburst Yellow, the optical mixture creates a dimensional warm-glow appearance. Do not apply this color to shadow areas; keep clear tonal separation between light and shadow zones.

COLORS

 PC927 Light Peach

◆ *Light Peach over Sunburst Yellow creates the classic warm portrait glow—it's the optical mixture of peachy transparent layer over golden undertone that creates that sought-after luminous quality impossible to achieve with single-layer color.*

09

Mid-Tone Optical Mixing with Warm Peachy Undertone

Entire midtone zone (neck, lower cheeks, sides of nose, temples); establish color continuity and dimension through layering

Medium pressure circular and directional motions following facial form; transparent layering for optical mixing

Medium pressure

Apply PC939 Peach with medium pressure across all midtone areas to create color continuity while adding dimension through warm undertone. Use this color to soften edges between previous layers and create smooth gradations from light cheeks to shadow areas. Work with circular motions on cheeks, vertical strokes on temples, following anatomical form. Peach has slightly more saturation than Light Peach, making it ideal for the true mid-value skin zones where full local color appears. Layer transparently so underlying value structure shows through; this creates dimensional skin appearance rather than flat painted surface. Where Peach overlays previous layers, it creates rich optical mixtures—over yellow creates warm orange undertone, over warm browns creates dimensional shadow transition.

COLORS

 PC939 Peach

◆ *Peach in midtones creates visual bridge between extremes of light and shadow—it's the workhorse color that makes the portrait read as coherent form rather than disconnected value zones.*

IO

Warm Glaze Unification & Undertone Variation

Entire face with emphasis on transition zones between previously worked areas; create color harmony and eliminate visible brushwork

Very light pressure glaze application with circular motions; multiple transparent passes for smooth integration; careful transition blending

Light pressure

Using PC1013 Deco Peach (and PC1084 Ginger Root in feature areas like cheek apples and lip contours) with very light pressure, apply a transparent warm glaze across the entire face to unify color temperature and create smooth transitions between value zones. Deco Peach is extremely pale and transparent, making it ideal for glaze layering without darkening underlying colors. Apply with light circular motions, blending edge transitions where previous pencil strokes might appear. This glaze creates the optical effect of unified skin tone while preserving underlying dimensional structure. In feature areas (cheeks, lips), substitute PC1084 Ginger Root for slightly warmer undertone variation preventing monotony. The glaze layer is where the portrait transitions from technical color-building to creating unified appearance. This step typically requires 3-4 light passes to achieve smooth, transparent glaze effect.

COLORS

PC1013 Deco Peach

PC1084 Ginger Root

◆ *This unification glaze is where student work separates from professional results—the glaze eliminates visible pencil texture while preserving all underlying dimensional structure, creating the illusion of smooth, lit skin.*

II Highlight Establishment & Cool Light Introduction

Brightestpoint highlights (forehead center, nose bridge, cheekbone tops, Cupid's bow) and large highlight areas (upper cheeks, upper eyelids); establish light hierarchy

Light pressure layering for Peach Beige (2-3 passes), extremely light pressure transparent glazing for Powder Blue; no pressure variation or blending

Light pressure

Apply PC1085 Peach Beige with light pressure on all secondary highlight areas (upper cheeks, temples, forehead sides) to establish the lighter value before introducing the brightest point highlights. Peach Beige is pale cream with warm undertone, perfect for highlights that don't require pure white. Layer with light pressure in 2-3 passes to build soft, glowing highlight appearance. Then apply PC1087 Powder Blue with extremely light pressure into highlight zones as subtle cool undertone reflecting cool ambient light—this prevents highlights from reading as isolated white spots. The cool blue undertone in highlights creates atmospheric accuracy (light from sky is cool-tinted) while maintaining portrait warmth overall. Apply Powder Blue so delicately that it reads as cool undertone rather than distinct blue color. These layers create highlights that appear naturally luminous rather than painted.

COLORS

PC1085 Peach Beige

PC1087 Powder Blue

◆ *Highlights with cool undertone (blue) over warm skin create the optical illusion of true light—the cool-warm contrast makes both read more convincingly. Warm-only highlights appear flat and artificial by comparison.*

I2 Feature Detail & Local Color Refinement

Eyes (iriscolor, pupil definition, eyewhitewarmth), lips (rose-brown undertone, dimension), nostril shadow; refine feature-specific color and value

Precise sharp-point application with directional pressure following feature structure; layer transparent glazes for optical mixing; maintain consistent temperature harmony

Varies pressure

Refine eyes by layering PC1087 Powder Blue in eye whites to establish cool undertone (eyes appear whiter and brighter when surrounding warm skin makes them read cooler), then apply subtle warm undertone glaze in corner areas. For iris, apply layered warm-brown and cool undertone in appropriate proportions matching reference image. For lips, apply PC1084 Ginger Root as warm rose-brown undertone, then layer with PC1092 Nectar in shadow areas of lip dimension. Nostrils receive PC1081 Chestnut with heavy pressure to establish deep shadow structure. Work with precise pencil tip (sharp point essential) for fine detail control. Feature detail work is where precision matters most—sloppy feature work undermines otherwise excellent portrait painting. Layer feature colors with same transparency principle as rest of portrait; avoid opaque single-layer appearance.

COLORS

PC1087 Powder Blue

PC1084 Ginger Root

PC1092 Nectar

PC1081 Chestnut

◆ *Features carry disproportionate visual weight in portraiture—imprecise eye and lip work makes entire portrait fail despite excellent face painting. Spend 20% of total time on feature detail despite features comprising only 10% of visible face area.*

13

Edge Quality & Soft Transition Refinement

Alltonal boundaries (light-shadow edges, shadow-midtone transitions, face-background edges); create lost edges characteristic of photorealistic portraiture

Tortillon stump light circular blending with gentle pressure; transparent glaze application to soften edges; preserve underlying structure while smoothing surface

Light pressure

Using tortillon stump and light circular motions, gently blend edge transitions where tonal boundaries appear too hard or where pencil texture shows. Focus on light-shadow boundaries on cheeks and face sides (these should show graduated, soft transitions). Apply PC1013 Deco Peach glaze along boundaries to further soften transitions. The goal is to create predominantly soft edges with very few hard edges (which should appear only at feature lines—eye outline, lip line, nostril edge). Blending should preserve underlying dimensional structure while smoothing surface appearance. This is where careful restraint matters—over-blending creates muddy, soft appearance; under-blending shows pencil texture disrupting realism. Work with tortillon rather than pencil blending to allow finer control and avoid destroying existing work.

COLORS

PC1013 Deco Peach

♦ *Photorealistic edge quality depends on understanding where hard edges should appear (feature definition lines) versus where soft edges belong (form transitions)—incorrect edge placement signals amateur work despite good color execution.*

I4

Deep Shadow Enrichment & Chestnut Darkening

Deepest shadow recesses (eye socket interiors, nostril shadows, under-chin shadow core, right face shadow fold); establish final depth dimension

Heavy pressure in shadow cores only; directional strokes following form geometry; careful placement to preserve established shadow structure

Heavy pressure

Apply PC1081 Chestnut with heavy pressure into the darkest existing shadows to enrich depth and establish final value floor. This deep warm brown darkens shadow zones while maintaining warm temperature harmony. Layer Chestnut over existing warm-brown and cool-purple shadow layers, allowing its warm undertone to optically mix with cool undertones beneath, creating visually rich dark browns rather than pure greys or blacks. Apply with directional pressure following form geometry; heavy pressure in shadow cores, medium pressure at shadow edges. Chestnut is the final deepening color that completes the shadow-to-light value range. Do not apply Chestnut broadly; reserve it for actual darkest recesses where shadow appears to fold or where form structure creates deep shade.

COLORS

PC1081 Chestnut

◆ *Final darkening is where amateur work often fails—using black or neutral grey instead of warm-rich Chestnut makes shadows appear foreign and artificial rather than integral to portrait form.*

I5

Burnishing & Final Highlight Luminosity

Brightest highlight points (forehead center, nose bridge tip, cheekbone peaks, Cupid's bow catchlight) and areas requiring final luminosity enhancement; establish final light quality

Heavy pressure point application for specular highlights; sharp pencil tip; only on absolute brightest areas; minimal application

Heavy pressure

Using PC938 White with extremely heavy pressure, apply only to the absolute brightest, smallest point highlights—forehead center, nose bridge tip, upper cheekbone peaks. These white highlights should comprise less than 2% of portrait area; they are final punctuation marks indicating maximum light reflection. Apply white with sharp pencil tip and heavy pressure for just 1-2 passes; these burnished white points should read as specular gloss, not matte highlight. Before applying white, ensure all surrounding areas are complete and permanent (no future changes)—white pencil cannot be layered over without appearing chalky. Alternatively, use colorless blender pencil with heavy pressure on already-light areas to create luminous burnish effect without adding white (preferred for more subtle results).

COLORS

☒ PC938 White

♦ *White highlights are the portrait's final punctuation—apply too much and the portrait appears overexposed and artificial; apply too little and it lacks final luminous quality. Restraint in highlight application separates photorealistic work from over-rendered amateur work.*

I6 Final Atmospheric Integration & Peripheral Softening

Entire portrait with emphasis on edges, background interface, and peripheral facial areas; create atmospheric unity and prevent isolated appearance

Extremely light pressure final glaze following face contours into peripheral areas and background interface; tortillon touch-up blending where needed

Light pressure

Using PC1013 Deco Peach with extremely light pressure, apply one final unification glaze across entire face, working slightly into background area where face-background edge occurs (creating soft atmospheric halo). This final glaze creates the illusion that portrait exists within space rather than appearing as isolated face on white paper. Avoid white paper showing around face edges; instead, create soft warm glow transitioning portrait into surrounding space. Apply the glaze with such light pressure it barely registers—this is the thinnest possible layer, purely atmospheric in effect. Any remaining visible pencil texture should be addressed with tortillon gentle blending. Final check: step back from artwork 3-4 feet and assess overall warmth consistency, value range completeness, edge quality uniformity, and feature clarity. The portrait should read as unified warm portrait with convincing form dimension, not as assembled color patches.

COLORS

PC1013 Deco Peach

♦ *The final glaze separates finished artwork from work-in-progress—it creates the atmospheric quality that allows viewers to perceive portrait as believable three-dimensional form in space rather than technical color exercise.*

Evaluate Your Result

Upload your finished drawing to Claude and use this prompt:

"I followed a colored pencil portrait tutorial. Here's what I was trying to achieve: [describe the portrait].
Here's what I think went well: [your observation].
Here's what I'm not satisfied with: [your concern].
Give me 2-3 specific things to improve and rate the result 1-10."
