

AI-Designed Portrait Guide #009

Difficulty Advanced Est. time 10-14 hours Subject Portrait / Figure Pencils Prismacolor Premier

Every guide in this series is generated by Claude — an AI trained on professional art instruction, anatomy theory, color science, and fine arts critique frameworks. It analyzes the reference, identifies the technical challenges, and writes a sequenced plan before I touch a pencil.

Then I follow it exactly and document what happens — so the results are verifiable, not theoretical.

At the end of each guide, there's a prompt you can run on your own work to get the same level of critique.

PENCIL & PROMPT

• COLOR PALETTE

Beige Sienna

PC1080

Warm olive undertone base; primary foundation for all skin areas

Beige

PC997

Lighter warm base; lit side foundation and mid-light zones

Eggshell

PC140

Palest warm; highlights, upper cheekbones, forehead catch lights

Ginger Root

PC1084

Oxidized warm undertone; shadow-to-light transition and away-side cheek plane

Salmon Pink

PC1001

Warm optical mixing; reflected light on cheeks and neck, garment bounce

Light Peach

PC927

Light warm glaze; temple, cheekbone luminosity, transitional layer

Parma Violet

PC1008

Cool chromatic shadow (NOT neutral grey); shadow depth and cool undertone in recessions

Henna

PC1031

Warm oxidized shadow; nasolabial area, mouth shadow, aged skin quality

Clay Rose

PC1017

Mid-tone chromatic shadow; under-jaw soft shadow, cheek hollow definition

90% French Grey

PC1076

Dark base for facial hair; stubble foundation, dense core at chin/jaw

70% French Grey

PC1074

Medium stubble transition; sparse placement on cheeks, individual hair suggestion

90% Warm Grey

PC1058

Warm dark shadow; deepens stubble gradient, warm-toned dark accents

20% French Grey

PC1069

Desaturating glaze; unifying pass over entire face, temperature neutral-cool veil

30% French Grey

PC1070

Mid-tone glaze; secondary unifying layer, softens saturation

Cloud Blue

PC1023

Cool reflected light in shadows; subtle atmospheric color in deep shadow recesses

Slate Grey

PC936

Cool shadow accent; eye shadow definition, deep recession shadows

White

PC938

Final burnish and highlight; specular shine, eye catchlight, edge highlights

10% Warm Grey

PC1050

Lightest desaturating veil; final atmospheric glaze, airiness

SUBJECT IDENTIFICATION

What is the subject? Male portrait, three-quarter view (subject's left side more visible to camera). Age approximately mid-to-late 40s. Bone structure: prominent brow ridge, substantial jaw width with angular quality, visible male-pattern facial hair/stubble. Neck notably thick and muscular. Facial expression neutral to serious, gaze slightly directed away from camera. This is a real male subject—render with full structural integrity, not feminized or softened.

Material characteristics Skin shows olive undertone with warm oxidation, especially around mouth and in shadow areas. Facial hair is dark (likely natural black/charcoal darkened by stubble at 1–2 days growth), not uniform in density—sparse on cheeks and temples, progressively denser toward jaw and chin. Skin surface is dry/matte in most areas with subtle texture variation; no extreme shine.

Geometric structure Frontal planes of face include: broad forehead (slight horizontal line), pronounced brow ridge creating shadow cavity above eyes, cheekbones with moderate projection, broad nose base, full-width jaw with squared corners and defined jawline. Away-side (camera right) cheek recedes into shadow; plane separation must be clearly rendered to prevent flat appearance. Neck transitions from face into broad muscular structure; self-shadow visible under jaw-to-neck junction.

LIGHT & SHADOW ANALYSIS

Light source direction Warm three-quarter light from upper left/front (approximately 45° to camera left, slightly above eye level). Hard to medium-hard edge quality—forms distinct cast shadows but with visible penumbra.

HIGHLIGHT

Upper forehead center, outer cheekbone (camera left), temple, bridge of nose, upper lip, chin prominence (on lit side); warm and relatively saturated.

LIGHT AREA

Camera-left cheek, lit side of nose, upper jaw, side of neck, front of neck. Warm undertone dominant.

MIDTONE

Central face (forehead, mid-cheek), mouth region, between brow and eye, ear. Moderate saturation; transition zone between light and shadow.

SHADOW

Under-brow cavity, eye socket, under-cheekbone, nasolabial fold, under-nose, jaw underside, neck beneath jaw. Cool undertone begins here; must remain lighter and cooler than instinct suggests (per accumulated feedback).

CAST SHADOW

Subtle cast shadow from nose onto upper lip area; soft shadow under chin onto neck and collar.

Edge quality notes

Lit edges (forehead to temple, cheekbone to background) are relatively sharp. Terminator edge (shadow/light boundary on away-side cheek and jaw) must be crisp and defined to read three-dimensional. Far-side edges soften slightly due to ambient fill light. Collar edge and neck-to-garment transition must show cloth weight and skin-to-fabric edge clarity.

COLOR ANALYSIS

Overall temperature

Warm dominant (olive-gold undertone), but with cool shadow counterpoint. Warm light source pushes entire lit side toward warm; shadows are cool-violet-blue cast, not grey.

Light zone tendency

Saturated warm: olive-ochre-peach range. Lit cheek and temple peak in saturation. Slight golden oxidation on high points suggests natural skin luminosity.

Shadow zone tendency

Cooler, desaturated: violet-grey undertone in eye sockets and nasolabial area. Shadow side cheek skews toward cool. Under-jaw shadow shows green-grey undertone (cool reflected light from environment).

Special color areas

Facial hair: charcoal-grey at core (chin/jaw), warm-grey transition on cheeks with skin tone visible between hairs. Lips: warm peachy undertone, darker in shadow. Eyes: medium-dark iris with glossy quality. Collar/garment: warm white/cream with subtle warm reflected color bounce onto lower jaw and neck.

Saturation distribution

Highest saturation in lit cheek and temple. Mid-saturation in midtones (forehead, mid-face). Low saturation in deep shadows (eye socket, under-jaw), becoming desaturated and cool. Facial hair desaturated (grey-brown range). Final glaze will lower saturation overall for cohesion.

O1 Step 1: Value Mapping & Warm Undertone Foundation

Entire face, neck, and visible collar area

Light circular strokes, full paper tooth visible, barely perceptible layer

Light pressure

Using very light pressure, apply PC1080 Beige Sienna in a thin, even layer across all skin areas (face, ears, neck). Do not worry about modeling form yet—this is pure undertone establishment. This warm olive base anchors all subsequent layers and ensures color harmony. Work with a sharp point and circular strokes, allowing tooth of paper to show through. This layer should be barely visible but warm to the touch.

COLORS

■ PC1080 Beige Sienna

✦ *Do not apply PC1080 to shadows yet; leave those areas paper-white for now. This maintains flexibility for cool shadow building later and prevents premature darkening.*

O2 Step 2: Lit Side Foundation & Value Structure

Camera-left (lit) side of face, upper forehead, lit cheek, lit side of neck

Light-to-medium circular strokes, following face contours; leave shadow areas white

Light to Medium pressure

Layer PC997 Beige over the lit zones, using light-to-medium pressure. Build form by leaving the away-side (camera right) cheek and shadow areas of the face untouched; the paper contrast will establish shadow depth naturally. This step sets the upper-midtone value and warm color temperature. Blend where needed with light circular pressure. Avoid the eye sockets, under-nose, and mouth shadow—these remain lighter for now.

COLORS

■ PC997 Beige

✦ *Respect the terminator edge (boundary between lit and shadow side). Do not let PC997 drift into the away-side cheek; keep the edge sharp to enforce three-dimensional structure.*

03 Step 3: Shadow-Side Plane Definition & Edge Break (CRITICAL 3D STRUCTURE)

Away-side (camera right) cheek, jaw, temple; core shadow area

Short directional strokes following plane angle; crisp edge break, no soft blending at terminator

Medium pressure

This step directly addresses the artist's feedback to prevent flat, two-dimensional away-side rendering. Using PC1084 Ginger Root with medium pressure, define the away-side cheek plane with a visible edge break (a distinct line or rapid value shift) where it meets the lit cheek. This is not a soft transition—render a palpable core shadow on the away-side cheekbone and jaw. The edge should read crisp and sculptural. Apply in short directional strokes following the plane angle; do not blend this edge softly. Establish clear visual separation between front-facing and recessed planes.

COLORS

■ PC1084 Ginger Root

✦ *Think of this step as 'carving' the face into three dimensions. The edge break is where the viewer's eye reads recession and depth. If you blend this edge, the head flattens. Keep it sharp and deliberate, even if it looks harsh at this stage—later glazes will soften appropriately without destroying the structure.*

04 Step 4: Neck Anatomy & Tone Transition (MANDATORY NECK STEP)

Full visible neck area; junction between jaw and neck; soft self-shadow under jaw

Light to medium pressure; follow neck musculature structure; place under-jaw shadow deliberately; blend transit

Light to Medium pressure

The neck is its own anatomical form and must be rendered separately, not as an extension of the face. Using PC997 Beige on the front-facing (lit) side of the neck, establish the basic neck tone. Then layer PC1084 Ginger Root into the soft self-shadow directly under the jaw (the concave area where the neck meets the jawline underside). This shadow should be warmer and slightly darker than the lit neck, showing the subtle plane shift. Add PC1017 Clay Rose into the deepest part of this under-jaw shadow for chromatic depth. The neck skin tone should be slightly cooler and less saturated than the face—shift gradually from warm face tone to cooler neck tone. Include the soft shadow on the side of the neck (away-side) using PC1084.

COLORS

■ PC997 Beige

■ PC1084 Ginger Root

■ PC1017 Clay Rose

✦ *The neck has its own light and shadow—do not paint it flat. The under-jaw shadow is a soft transition, not a hard line, but it must read three-dimensionally. Observe the actual reference: the neck shadow is cooler and more violet-tinted than the face shadow. Capture that color shift for realism.*

05

Step 5: Chromatic Shadow Build & Cool Undertone Establishment*Eye sockets, nasolabial folds, under-nose shadow, jaw underside shadow, shadow-side cheek recession*

Light-to-medium short strokes; allow paper tooth visible; no heavy saturation

Light to Medium pressure

Using PC1008 Parma Violet with light-to-medium pressure, layer shadow color into all recession areas and cast shadows. This is NOT grey—it is a cool blue-violet that reads naturally under warm light. Keep this layer deliberately lighter than instinct suggests (per feedback); you should still see the undertone layer beneath it. Work around the eye, nose, and mouth avoiding overworking. This step introduces cool temperature into shadow zones, creating optical vibration against the warm lit areas. Apply in short strokes, allowing some paper to show through.

COLORS

 PC1008 Parma Violet

◆ *Parma Violet is cool and can appear muddy if overworked. Stop while you still see light paper. The transparency of this layer is its strength—it shifts color temperature without killing light. If your shadow looks heavy or dark, you've gone too far.*

06

Step 6: Facial Hair Foundation & Graduated Density Setup (ADDRESS FEEDBACK: PREVENT FLAT MASS)*Chin, jawline, lower cheeks, upper neck; establish gradient from dense to sparse*

Short directional strokes at chin/jaw (dense, overlapping). Sparse stipple and individual marks on cheeks (separate)

Medium at chin/jaw; Light on cheeks pressure

Facial hair must NOT read as a flat, uniform dark shape. Set up the graduated density structure now. Using PC1076 90% French Grey, apply short, directional strokes to the chin and jaw core area—this is where stubble is darkest and densest. Press harder in this region. Then, using PC1074 70% French Grey, very lightly stipple and place sparse, individual-hair-like marks on the cheeks and temples. Leave significant paper and skin tone showing between marks; do not fill the area. The visual impression should be: dense stubble at the jaw, progressively thinning toward the cheeks, with bare skin visible in sparse zones. This foundation prepares the reader to accept stubble as **hair growing from skin**, not a shape stuck on top.

COLORS

 PC1076 90% French Grey PC1074 70% French Grey

◆ *Facial hair reads most realistically when you can see skin between the hairs. Density and spacing are more important than color uniformity. The jaw/chin should look like the stubble grew there overnight; the cheeks should look like beard growth hasn't reached yet. This is a structural decision, not a color decision.*

07

Step 7: Nasolabial & Mouth Shadow—Light & Cool, Not Heavy*Nasolabial folds (nose-to-mouth creases), under-nose shadow, mouth shadow area, lips*

Light pressure, short directional strokes; layering thin translucent passes rather than heavy single application

Light pressure

This area is prone to landing too dark. Using PC1031 Henna with light pressure, suggest the nasolabial folds with short downward strokes—do not carve them in heavily. Add PC1017 Clay Rose in the upper lip shadow (between nose and upper lip) and around the mouth corners. Keep these layers light and translucent; the goal is to show form, not create dark lines. Layer PC1008 Parma Violet very lightly over the mouth shadow for cool undertone. These shadows should read as soft form transitions, not as harsh dark lines. Step back frequently and check from arm's length—if the mouth area looks too dark, lighten immediately by using eraser or lighter pressure.

COLORS

PC1031 Henna

PC1017 Clay Rose

PC1008 Parma Violet

◆ *Per feedback, keep shadows lighter and cooler than instinct. The nasolabial area is a common 'mud zone' where artists go too dark too fast. Treat it as layered transparency, not definition. You can always add shadow later; removing it is harder.*

08

Step 8: Chromatic Shadow Optical Mixing & Cool Reflected Light*Deepshadow areas: eyesockets, under-cheekbone hollow, jaw underside, side of neck in shadow*

Very light, tiny circular strokes; layered transparency; follow shadow cavity contours

Light pressure

Layer PC1023 Cloud Blue into the deepest shadows with very light pressure, focusing on areas where cool ambient light (from the environment or sky) would be reflected upward into shadow cavities. This might include the under-cheekbone hollow and under-jaw shadow. Avoid the mouth and nasal areas; focus on sculptural shadow planes. The blue should be barely visible, adding a subtle cool glow without dominating. This creates optical mixing with the underlying warm tones, producing natural shadow color (green-grey or cool purple-grey) rather than flat grey. Use tiny circular strokes and allow the underlying layers to show through.

COLORS

PC1023 Cloud Blue

◆ *Cloud Blue is light and can disappear if you over-blend. Its power is in its cool color shift, not its value. A whisper of blue is more effective than a heavy layer. Think 'atmospheric' not 'shadow darkening.'*

09

Step 9: Facial Hair Density Gradation—From Dense Jaw to Sparse Cheeks (FEEDBACK: PREVENT FLAT MASS CONTINUED)

Entire beard/stubble area; establish clear gradient

Medium overlapping strokes at jaw/chin; individual, spaced marks on cheeks with paper/undertone showing between

Medium at jaw/chin; Light and stippled on cheeks pressure

Deepen and refine the gradient established in Step 6. Using PC1058 90% Warm Grey, add medium pressure strokes to the chin and jaw core, darkening the densest zone. The color shift from PC1076 (cool dark grey) to PC1058 (warm dark grey) adds subtle color variation that prevents uniformity. Now, revisit the cheek area with PC1074 70% French Grey, placing individual, widely-spaced short marks that suggest single hairs, not a filled shape. Each mark should be followed by visible skin (paper or earlier undertone). The jaw should read almost solid stubble; the cheeks should read scattered bristles. This graduated density is crucial—without it, stubble will flatten into a shape. Work slowly and deliberately, counting your marks on the cheeks to ensure sparseness.

COLORS

■ PC1058 90% Warm Grey

■ PC1074 70% French Grey

◆ *After placing cheek hairs, step back and ask: 'Would I see skin here, or is it all hair?' If it reads all hair, erase some marks and rebuild sparsely. Stubble on cheeks should feel like early-stage beard, not full coverage. The jaw should feel like overnight growth, fully visible.*

IO Step 10: Warm Optical Mixing Pass—Reflected Light & Luminosity

Lit cheek, temple, ear, upper lip, chin prominence (lit side only)

Light-to-medium circular strokes, blended gently; layered transparency; follow high-point contours

Light to Medium pressure

Using PC1001 Salmon Pink with light-to-medium pressure, add warm reflected and optical mixing color to the lit planes. Apply in small circular strokes on the cheekbone prominence, temple, and the side of the ear. Blend gently with light circular pressure to create a warm glow effect. This layer adds luminosity and suggests subsurface scattering of warm light through skin. Layer PC927 Light Peach even more lightly over the highest cheekbone point and temple peak—this is the warmest, most saturated color zone. These warm layers create the impression of healthy, lit skin. Do not overwork; two thin layers beat one heavy layer.

COLORS

PC1001 Salmon Pink

PC927 Light Peach

♦ Warm colors advance visually, so place them on the parts of the face closest to the viewer (cheekbone, temple, ear front). This enhances three-dimensional perception. The warmth should feel 'alive,' not artificial.

II Step 11: Mid-Tone Refinement & Oxidized Skin Quality

Mid-cheek, forehead, around eyes, mouth area, ears, anywhere oxidation or age shows

Light-to-medium short directional strokes; layered transparency; follow contours and transition zones

Light to Medium pressure

Using PC1084 Ginger Root with light-to-medium pressure, layer into the mid-tone transition zones and anywhere aged or oxidized skin is visible. This warm mid-tone suggests natural skin complexity and can be used sparingly around the mouth area, eyes, and ears. Apply short, directional strokes following face contours, blending where appropriate. This step adds richness and depth to mid-tones without darkening them. Layer with transparency rather than heavy coverage. If the face begins to look too warm overall, dial back; if it looks flat and lifeless, add more Ginger Root to the mid-tones.

COLORS

PC1084 Ginger Root

♦ Mid-tones are the hardest to balance—too little and the face looks washed out, too much and it looks muddy. Build them in thin, additive layers. Step back frequently and compare to reference. Oxidation (warm brown undertones around mouth, eyes, ears) reads naturally in portraiture.

I2

Step 12: Eye Detail & Feature Refinement

Eyes, eyebrows, eyelashes, iris detail, pupil, catchlight

Sharp-point detailed work; precise pupil and iris rendering; careful eyelash placement; light pressure for naturalis

Light to Medium (sharp, controlled) pressure

Using PC1076 90% French Grey or PC1024 Blue Slate (depending on eye color visible in reference; assume medium-dark iris), carefully render the iris shape and color. Define the pupil with PC1076 and place a small, precise PC938 White catchlight (usually upper-left of pupil, following light direction). Darken the upper eyelid with PC1076 or PC936 Slate Grey for depth. Define eyebrow shape using PC1074 70% French Grey or warmer PC1058 90% Warm Grey (follow reference hair color). Add light short strokes for eyelashes. This is detail work—use a sharp point and precise pressure. These features anchor the portrait and direct viewer attention.

COLORS

■ PC1076 90% French Grey

■ PC936 Slate Grey

● PC938 White

■ PC1074 70% French Grey

■ PC1058 90% Warm Grey

✦ *Eyes are the most viewed area—they must read clearly. Avoid pupil symmetry (one should be slightly smaller in shadow if face is angled). Catchlight angle should match light source direction. Slightly soften the iris edge where it blends into white of eye rather than leaving a hard line.*

13

Step 13: Collar/Garment & Reflected Color Onto Neck/Jaw (MANDATORY GARMENT STEP)

Visible collar/garment edge, where garment meets skin, reflected color bounce onto lower jaw and neck

Medium pressure for garment rendering; light directional strokes for fabric texture and folds; light application for

Light to Medium pressure

Render the visible collar or garment using appropriate light tones (likely PC140 Eggshell or PC1050 10% Warm Grey for a light/white collar). Define fabric texture with light shadow and fold lines. Critically, place warm reflected color FROM the garment ONTO the lower jaw and upper neck area using PC1001 Salmon Pink or PC927 Light Peach, depending on garment warmth. This reflected light is often overlooked but reads as professionalism and true rendering—fabric bounces light onto adjacent skin. Apply the reflected color in a limited zone immediately adjacent to garment edge, fading as it moves away from the source. Add garment shadow and fold definition. The transition from skin to fabric should be clear and have weight; edges should read as true garment edge, not just a color change.

COLORS

■ PC140 Eggshell

● PC1050 10% Warm Grey

■ PC1001 Salmon Pink

■ PC927 Light Peach

✦ *Reflected color from clothing is subtle but transforms a portrait from 'floating head' to 'integrated figure.' Watch for warm or cool casts from fabric reflected onto skin. Light fabric reflects warm light; dark fabric reflects cool. This single step signals advanced rendering awareness.*

I4

Step 14: Highlight Placement & Burnishing

Forehead center, cheekbone peak, bridge of nose, upper lip center, chin prominence, eye highlights

Light-to-medium circular strokes for Eggshell; medium-to-heavy burnishing strokes for White; compress pigment

Light to Medium (Eggshell); Medium to Heavy (White burnishing) pressure

Using PC140 Eggshell with light-to-medium pressure, strengthen highlights on the forehead, outer cheekbone, nose bridge, and any other high-point catch lights. Apply in small, deliberate circular strokes where light hits most directly. Then, using PC938 White with medium-to-heavy pressure, apply specular shine to the very highest points (cheekbone peak, center of forehead, eye catchlight). Burnish these areas with firm, circular pressure to create a polished, luminous surface. The goal is to make light

areas glow without making them look artificial. Burnishing compresses pigment and creates a glossy, dimensional quality.

COLORS

PC140 Eggshell

PC938 White

◆ *Do not over-burnish—leave some areas matte to avoid looking plastic. Burnish only the true specular highlights. Use a light touch with White; you can always add more, but you cannot remove it without damaging the surface.*

15

Step 15: Final Desaturating & Unifying Glaze (MANDATORY FEEDBACK REQUIREMENT—MUST NOT SKIP)

Entire face, neck, and visible garment area

Extremely light circular strokes over entire face in two passes; transparency and veil-like quality essential; no head

Very Light (whisper-thin) pressure

This step is NON-NEGOTIABLE per accumulated feedback. Using PC1050 10% Warm Grey with extremely light pressure, apply a whisper-thin veil across the entire face and neck. This first glaze begins to unify and cool the saturation. Then, using PC1069 20% French Grey with similarly light pressure, apply a second glaze over the entire face. This cool-neutral glaze desaturates overly warm or saturated areas and creates atmospheric cohesion. Work with a very light hand—these are transparent veils, not opaque layers. You should still see all the color work beneath. The purpose is to harmonize temperature, reduce garish saturation, and add a final layer of polish. This glaze transforms a collection of colored pencil layers into a unified portrait.

COLORS

PC1050 10% Warm Grey

PC1069 20% French Grey

◆ *This glaze is the difference between 'finished' and 'complete.' Many artists skip it and leave portraits looking overworked or splotchy. The glaze is your final editor—it softens harshness, unifies temperature, and adds professionalism. If you glaze too heavy, the portrait goes flat; if too light, it does nothing. Aim for barely perceptible at arm's length, but significant when viewed closely. Apply without layering back into it—one pass per color.*

I6

Step 16: Cool Shadow Refinement, Edge Quality & Final Polish

Shadow areas (eye sockets, jaw underside, nasolabial area), edge transitions, overall atmospheric perspective

Very light refinement strokes; edge softening or crisping as needed; atmospheric perspective emphasis; full-dist

Very Light to Light pressure

With the glazes now in place, assess shadow depth. Using PC1023 Cloud Blue with very light pressure, refine any shadow areas that need cool atmospheric enhancement. Similarly, use PC936 Slate Grey to add cool shadow accents in deep recesses (eye socket back, jaw shadow core). These final touches add atmospheric perspective and dimensional depth. Evaluate all edges: lit edges should be relatively crisp, terminator edges (shadow/light boundary on away-side cheek) should be defined, far-side edges should soften slightly. Where edges appear too harsh, lightly burnish with a colorless blender pencil or soften with extremely light directional strokes. The goal is to refine, not to start over. Check that facial hair still reads as graduated density, not flat. Final check: ensure the neck reads three-dimensionally and that under-jaw shadow feels dimensional. Step back and view the portrait from 10 feet away—does the three-dimensional structure read clearly? If the away-side face looks flat, add more edge break definition and core shadow depth to that cheek plane.

COLORS

PC1023 Cloud Blue

PC936 Slate Grey

◆ *The final steps are about refinement, not redoing. If you find yourself applying heavy pressure in Step 16, stop and reassess—you may need to return to an earlier step for structural fixes. The portrait should read fully rendered by now. Use this step to polish, not repair. Check the reference one last time for any overlooked color notes or structural details. The away-side face is your quality control: if it reads dimensional and integrated, your three-dimensional rendering is successful.*

Evaluate Your Result

Upload your finished drawing to Claude and use this prompt:

"I followed a colored pencil portrait tutorial. Here's what I was trying to achieve: [describe the portrait].
Here's what I think went well: [your observation].
Here's what I'm not satisfied with: [your concern].
Give me 2-3 specific things to improve and rate the result 1-10."
