

I'm not an art teacher. I'm someone who asked an AI to teach me how to draw portraits — and documented what happened. Every guide in this series starts the same way: I give Claude a specific challenge, it gives me a step-by-step plan, I follow it as closely as I can, and then I show you exactly what came out. At the end, you'll see a prompt you can use to get your own work critiqued. Follow along. There's no grading.

PENCIL & PROMPT

• COLOR PALETTE

Beige
PC997

Lightest warm highlight tone on forehead, nose bridge, and upper cheeks

Peach Beige
PC1085

First undertone wash on light-struck mid-face planes

Peach
PC939

Warm optical mixing layer on cheeks, nasolabial folds, and nose

Nectar
PC1092

Transitional midtone warm layer across cheek apples and chin

Henna
PC1031

Rich warm shadow base on shadow-side face, neck under jaw, and nostril wings

Sienna Brown
PC945

Deep warm mid-shadow; chromatic brown for forehead shadow and eye socket depth

Dark Brown
PC946

Core shadow and form shadow on cheekbone underside, jaw, and temple

Chocolate
PC1082

Darkest chromatic shadow in eye orbits, under nose, and jaw line

90% Cool Grey
PC1067

Cool shadow complement glaze in deepest shadow zones to desaturate and cool without deadening

Black
PC935

Pupils, darkest eyelash line, nostrils, deepest shadow accents in short cropped hair

Dark Umber

PC947

Hair base tone and eyebrow structure — chromatic alternative to black in medium-dark hair zones

Sepia

PC948

Hair shadow depth and five-o'clock stubble stippling

China Blue

PC1100

France jersey body — primary blue saturation layer

Ultramarine

PC902

Jersey shadow side and fold darks — deepen blue with cooler violet shift

Carmine Red

PC926

Red collar stripe on France kit

White

PC938

White collar stripe, tooth highlights, specular skin highlights, and burnishing layer

Yellow Ochre

PC942

Gold star emblem on jersey and warm reflected light on lower jaw / neck from jersey

Rosy Beige

PC1019

Lip mid-tone and inner mouth visible area — cool-pink transition

SUBJECT IDENTIFICATION

What is the subject?

Close-up head-and-shoulders portrait of a young Black male athlete wearing the French national football team blue kit with tricolor collar detail and gold stars. The subject is smiling broadly, revealing upper teeth.

Material characteristics

Skin is smooth with medium-deep brown complexion showing subtle specular highlights on forehead, nasal bridge, and cheek prominences. Hair is very short, tightly coiled, and dark with minimal individual strand visibility — rendered as a textured mass. Jersey fabric is synthetic blue with visible collar stitching.

Geometric structure

Broadly oval cranium with strong cheekbone structure, wide jaw, prominent nasal bridge, and large eyes set under a moderately sloped forehead. The face is nearly front-facing with a very slight three-quarter turn to subject's left. The neck is thick and cylindrical, connecting to broad shoulders.

LIGHT & SHADOW ANALYSIS

Light source direction

Frontal studio light slightly above and centered — typical sports photography key light. The light is relatively flat and even to reveal facial features without dramatic Rembrandt or split lighting.

HIGHLIGHT

Forehead center above the brow line, nasal bridge, cheekbone prominences bilaterally, and the cupid's bow of the upper lip. Small specular point on the tip of the nose.

LIGHT AREA

Upper forehead, most of the cheek apples, upper lip, and lower central chin. The neck has diffuse light on the front plane.

MIDTONE

Temples, sides of the nose, the philtrum, the cheeks transitioning toward the ears, lower jaw sides, and the side planes of the neck.

SHADOW

Under-eye orbital areas, sides of the nose, nasolabial fold shadows, corners of the mouth, beneath the lower lip, under the jaw, and the side of the neck. The ear region transitions into shadow.

CAST SHADOW

No hard cast shadows from external objects. The jaw casts a soft self-shadow onto the upper neck. The nose casts a very soft shadow on the upper lip area.

Edge quality notes

All edges are soft to lost — studio lighting and smooth skin mean no hard transitions except at the hairline (sharp), lash line (sharp), and lip edge (firm but not hard). The hair silhouette against the white background is the sharpest edge in the entire composition.

COLOR ANALYSIS

Overall temperature

Warm overall — the skin tone is a rich warm brown with golden undertones. The white background is neutral. The jersey introduces a strong cool blue counterpoint in the lower third.

Light zone tendency

Light zones on the skin shift warmer and slightly more saturated — golden-peach on the highlights, warm amber-tan in the lit midtones.

Shadow zone tendency

Shadows cool and desaturate — moving from warm sienna-brown into cooler deep umber-chocolate, with a subtle violet-cool quality in the very deepest zones under the jaw and eye sockets.

Special color areas

The lips show a muted rose-mauve tone distinct from surrounding skin. The whites of the teeth have a slight warm cream cast, not pure white. The jersey blue is a vivid royal/France blue. The collar has a bright red stripe and a white stripe. Gold stars are visible lower right.

Saturation distribution

Highest saturation at the cheek apples and the jersey blue. Shadows desaturate significantly. Highlights are lighter and slightly less saturated than upper-midtones. The hair is very low saturation — near-black with warm undertone.

OI Step 1 — Transfer and Tonal Value Map

Entire composition — structural linedrawing and value zone demarcation

Ghost-pressure value zone blocking with circular micro-strokes;
paper white preservation in specular zones

Light pressure

Using a light box and tracing paper, transfer a clean contour line drawing to your plate bristol, capturing the hairline boundary, eye sockets, nasal wings, lip edges, jaw contour, collar line, and ear perimeter. Keep lines extremely light — no harder than HB graphite — as wax-based pencil will not cover heavy graphite grooves. Once transferred, use a light application of PC997 Beige to lightly block in the entire face and neck area with barely-there, open circular strokes at near-zero pressure; this tints the paper surface and eliminates the stark white so subsequent color reads more accurately. Using a grayscale printout of your reference, mentally map five tonal zones: specular highlight (paper white reserved or PC938), light (PC997 zone), midtone (PC939/PC1092 zone), shadow (PC1031/PC945 zone), and core shadow (PC946/PC1082 zone). This mental mapping governs every subsequent pressure decision.

COLORS

 PC997 Beige

 PC938 White

◆ *Reserve the specular highlights on the forehead, nasal bridge, and cheekbones as paper white from the very first stroke — it is far easier to protect white than to recover it. Mask these micro-zones with a tiny piece of removable frisket film if needed before laying any pencil.*

O2 Step 2 — First Skin Undertone Wash (Light and Midtone Zones)

Forehead, cheeks, nose bridge, and chin — all light-to-midtone skin planes

Uniform circular micro-stroke layering to fill paper tooth; zonal pressure gradient (lighter at highlights, medium elsewhere)

Light pressure

Apply PC1085 Peach Beige across the entire light and midtone zones of the face using light, even circular strokes, leaving paper white in the three specular points (forehead center, nasal bridge, and cheekbone prominences). This warm peachy undertone establishes the skin's subdermal warmth that will optically mix with all subsequent layers. Follow immediately with PC997 Beige layered over the lightest zones only (upper forehead, cheek highlights) to push those areas cooler-light and slightly more golden. Work in tight, consistent circles approximately 1–2mm in diameter to fill paper tooth evenly without directional stroke artifacts. The neck and jaw light plane receive the same treatment but slightly darker — apply a second pass of PC1085 here to establish relative value difference from the face.

COLORS

PC1085 Peach Beige

PC997 Beige

◆ *This first undertone layer is the 'skin temperature decision' — Peach Beige here locks in the warm golden-brown subdermal glow that distinguishes a living complexion from a flat brown fill. Resist the urge to go darker yet; build value incrementally through many transparent layers rather than one opaque hit.*

03 Step 3 — Warm Midtone Development (Cheeks, Nose, Nasolabial Area)

Cheek apples, sides of the nose, nasolabial folds, chin ball, and upper lip plane

Form-following curved strokes on cheeks; optical mixing transition between two warm analogous oranges; selective colorless blender

Light to Medium pressure

Introduce PC939 Peach at medium-light pressure across the cheek apples — the zone directly below the eye where a blush-warm tone is always most visible in Black skin when lit frontally. Use short, curved strokes that follow the convex form of the cheek. Build PC939 also along the nasolabial fold transitions (not the shadow itself — just the transition zone adjacent to the highlighted central face). Apply PC1092 Nectar at slightly higher pressure in the areas immediately transitioning into shadow: the sides of the nose, the upper nasolabial line, the area below the lower lip, and the chin underplane. These two colors create an optical mix zone that reads as the warm, saturated midtone characteristic of deeply pigmented skin under warm studio light. Blend lightly between the two using the Colorless Blender only at the transition edges.

COLORS

PC939 Peach

PC1092 Nectar

◆ *PC939 and PC1092 are adjacent on the warm orange-brown spectrum; layering them together creates a saturated mid-brown that reads more chromatically alive than a single 'brown' pencil ever could. The optical mixing is the secret to luminous skin — Kullberg's approach exactly.*

04 Step 4 — Shadow Underpainting (Chromatic Warm Shadows)

Eye sockets, under-nose shadow, jaw shadow, neck shadow, and nasolabial shadow grooves

Elliptical form-following strokes in concave areas; chromatic shadow layering (warm base before cool modifier); smooth gradient at shadow-midtone boundary

Medium pressure

Establish the chromatic shadow structure with PC1031 Henna at medium pressure in the primary shadow zones: the orbital areas above and below each eye (follow the actual concave socket form with elliptical strokes), the shadow under the nose falling onto the upper lip, the full shadow side of the neck, and the shadow beneath the lower lip. PC1031 Henna is a rich warm reddish-brown that reads as a convincing shadow complement to the warm-lit skin rather than a deadening grey or neutral brown. In the deepest parts of these same zones — directly under the brow ridge, the nostril attachment, and the jaw underplane — reinforce with PC945 Sienna Brown at medium pressure on top of the Henna, blending their boundary with small circular strokes. These two warm shadows create the chromatic foundation that all subsequent cool-shadow glazes will modify without ever losing warmth.

COLORS

PC1031 Henna

PC945 Sienna Brown

◆ *Never start a shadow pass with your darkest dark — Henna here is a placeholder that keeps optionality. If you drop PC946 or PC1082 in at this stage without this warm underpainting, the shadows will look hollow and lifeless. The warm undertone beneath the dark brown creates the impression of skin subsurface scattering.*

05 Step 5 — Deep Shadow Reinforcement and Core Shadow (Eye Orbits, Jaw, Under-Lip)

Core shadows: underbrow overhang, inner eye corners, jaw underplane, and shadow-side neck

Heavy-pressure core shadow application followed by Colorless Blender burnish; complementary cool grey glaze over warm brown for chromatic grey shadow

Medium to Heavy pressure

Apply PC946 Dark Brown at medium-heavy pressure directly over the established Henna and Sienna Brown layers in the darkest zones: the upper orbital shadow directly under the brow, the tight shadow where the nose wing meets the cheek, the shadow beneath the lower lip, and the full underside of the jaw. Burnish lightly with the Colorless Blender immediately after each small zone to push the color into the paper and blend transitions. Follow with a targeted glaze of PC1067 90% Cool Grey at very light pressure over the deepest jaw shadow and under-eye orbit only — this cool grey complement slightly neutralizes the warm shadow without killing its color, creating the chromatic grey effect of deep shadow in Brown skin that reads neither orange nor flat grey. The interaction of warm brown + cool grey glaze produces a sophisticated desaturated dark.

COLORS

PC946 Dark Brown

PC1067 90% Cool Grey

◆ *The cool grey glaze over dark brown is one of the most powerful tools for skin shadow work — it mimics how neutral shadows in dark complexions carry subtle blue-violet coolness due to atmospheric and ambient light. Apply PC1067 with a dulled pencil tip in tiny circular strokes at ghost pressure to avoid dragging up underlying pigment.*

06 Step 6 — Eye Structure: Irises, Pupils, Whites, and Lash Lines

Both eyes — iris, pupil, sclera, and eyelid margins

Sharp-point heavy-pressure iris/pupil fill; fine-line lash root stroke; ghost-pressure warm tint on sclera; specular dot preservation

Varies — Heavy on pupils/lashes, Light on sclera pressure

Establish the dark iris rings first: the irises appear very dark brown in this image — apply PC946 Dark Brown with a sharp point in tight circular strokes filling the iris, leaving a tiny paper-white crescent at the top (catch light location) and a small specular dot in each iris (upper left of pupil). Apply PC935 Black at heavy pressure over the pupil center and pupil ring, feathering slightly into the outer iris edge. The lash line on the upper lid is applied with PC935 at heavy pressure using a sharp point; use a fine stroke along the lash root rather than a thick band, tapering to almost nothing at the inner corner. The sclera (whites of the eyes) are NOT pure white — apply a very light pass of PC1085 Peach Beige and PC997 to create a warm cream tone, then leave the small reflected light area on the inner lower sclera slightly lighter. Tiny red-pink veins in the sclera can be suggested with a single delicate stroke of PC1092 near the inner canthus.

COLORS

PC946 Dark Brown

PC935 Black

PC1085 Peach Beige

PC997 Beige

PC1092 Nectar

♦ *The catch light and specular dot in the iris must be preserved as paper white or recovered with an electric eraser — they are the single most important micro-detail that makes eyes look alive. Even at this portrait scale, losing the catch light flattens the entire face. Use frisket or a deliberate eraser recovery before final burnishing.*

07 Step 7 — Facial Feature Details: Nose, Lips, and Teeth

Nose (nostril wings, tip, columella), lips (vermilion border, lip color), and visible upper teeth

Heavy-pressure sharp-point nostril darks; delicate rosy glaze on lips; warm cream tint on teeth with grey inter-dental shadows

Varies — Heavy on nostril darks, Light on teeth and lip tints pressure

For the nose: reinforce the nostril attachment shadows with PC1082 Chocolate at heavy pressure using a sharp point — the darkest darks in the face are the nostril openings and inner lash line. Apply PC945 Sienna Brown along the nostril wing edge where it transitions from light to shadow. The tip of the nose gets a light burnish of PC997 Beige to push the specular slightly lighter. For the lips: the upper lip (in shadow) receives PC1019 Rosy Beige at medium pressure across the entire lip surface, then PC1092 Nectar at the corners where the lip meets skin. The lower lip, lighter and more forward, gets PC1085 Peach Beige with PC1019 in the shadow groove below the lip. For the teeth: apply a light wash of PC997 and PC1085 to create a warm cream rather than white — the teeth are never pure white in photographic reference. Leave the central upper tooth faces slightly lighter (paper white or single pass PC997 only) and apply PC1067 Cool Grey at ghost pressure in the tiny crevices between teeth.

COLORS

PC1082 Chocolate

PC945 Sienna Brown

PC997 Beige

PC1019 Rosy Beige

PC1092 Nectar

PC1085 Peach Beige

PC1067 90% Cool Grey

◆ *The lips on dark skin in warm light carry a complex muted rose-terracotta tone — not the pink of lighter skin. PC1019 Rosy Beige gives exactly this muted warm-pink characteristic without going too purple or too red. Avoid any pure pink or magenta entirely here.*

o8 Step 8 — Hair Mass: Base Tone and Shadow Structure

Entire hair mass — base color, tonal structure, and volume shadow

Stippling micro-strokes to simulate tight coil texture; sharp-edge hairline definition; tonal gradient from stippled light crown to denser shadow sides

Medium pressure

The hair is very short, tight-coiled, and dark brown-black. Begin with PC947 Dark Umber across the entire hair mass using short 1–2mm stippling strokes that suggest coil texture — do not use smooth layered strokes here, as the stipple mimics tight curl clusters. Apply at medium pressure, leaving the hair's lightest zones (the crown receiving direct light) slightly less densely stippled. Follow with PC948 Sepia over the darker parts of the hair: the sides above the temples, the hairline shadow zone, and the areas behind the ears. The boundary between hair and skin at the hairline is one of the image's sharpest edges — use a freshly sharpened PC948 to define this edge with precision, tapering the hairline edge realistically (individual tight hair follicles, not a ruler-straight line). Leave a barely perceptible lighter zone on the crown to suggest the studio light catching the short hairs.

COLORS

■ PC947 Dark Umber

■ PC948 Sepia

♦ *Stippling is the key to rendering tightly coiled Afro-textured hair convincingly — avoid any hatching or blended smooth strokes, which will read as wavy or straight hair. Vary stipple dot density rather than pressure to control value: dense dots for dark areas, sparse dots for lighter zones.*

09 Step 9 — Hair Mass: Depth, Core Darks, and Silhouette Edge

Hair shadow zones, sideburn fade, hairline edge against white background

Dense stippling for deep shadow zones; sharp silhouette edge with textured-irregular contour; fade-taper transition with graduated stipple density

Medium to Heavy pressure

Apply PC946 Dark Brown at medium-heavy pressure over the lower sides and temporal hair zones to build depth, using the same stippling technique but with the strokes densely packed. In the areas above and behind the ear where the hair fades into skin (a subtle fade/taper cut is visible), blend the hair edge into the skin using lighter stippling that gradually becomes skin tone — the transition from hair to skin in a fade cut is one of the most technically demanding micro-areas in this portrait. Apply PC935 Black at heavy pressure sparingly in the very darkest interior shadows of the hair mass (not the full hair — just shadow pockets deep in the crop). The silhouette edge of the hair against the white background should be rendered with a freshly sharpened dark pencil in a slightly irregular, textured stroke that implies individual coil tops — never a perfectly smooth contour.

COLORS

■ PC946 Dark Brown

■ PC935 Black

♦ *The hair silhouette against a pure white background is technically the most exposed edge in the entire drawing — any wavering or overworked edge will immediately read as amateur. Use a bridge (ruler held slightly above the paper surface) to guide your hand if needed for the transition zones while keeping the contour itself micro-irregular.*

IO Step 10 — Five O'Clock Shadow and Facial Hair Stubble

Jaw, chin, upper lip (philtrum), sideburns, and mustache region

Directional micro-stipple following hair growth vectors; graduated density from fade-taper transition with graduated stipple density

Medium pressure

Very short stubble is visible across the jaw, chin, philtrum area, and connecting to the sideburns. Use a very sharp PC948 Sepia tip to make the tiniest individual stipple marks aligned with actual hair growth direction (downward on cheeks, inward from the outer mustache) at medium pressure. Do not apply these marks evenly — concentrate them most densely at the chin center, upper lip corners, and along the jaw angle; thin them out as they approach the clean shave zone of the mid-cheek. A light pass of PC945 Sienna Brown under the stipple marks ties the stubble visually to the surrounding shadow skin tone so it doesn't look like independent dots. In the sideburn area above the ear, use extremely fine hatching rather than stippling as these hairs are slightly longer and transition into the hairline. Finish with a pass of PC946 Dark Brown at the chin shadow to integrate the darkest stubble zone.

COLORS

PC948 Sepia

PC945 Sienna Brown

PC946 Dark Brown

♦ *The most common amateur error with stubble is making every dot the same size and equally spaced, creating a mechanical polka-dot pattern. Vary size (sharp vs. slightly dulled tip), spacing, and the occasional tiny short stroke versus dot to replicate the organic irregularity of real stubble growth.*

II Step 11 — Jersey: France Blue Body and Fold Structure

Blue jersey body from collar to lower frame, including fabric fold shadows and highlights

Directional vertical stroke blue block-in; shadow deepening with cooler analogous blue; fade-taper transition with graduated stipple density

Medium to Heavy pressure

Block in the entire jersey area with PC1100 China Blue at medium pressure using directional strokes that loosely follow any visible fabric drape (vertical strokes on the body, slightly angled at shoulder curves). Apply evenly across the lit face of the jersey. Then immediately add PC902 Ultramarine at medium-heavy pressure on the shadow side of the jersey (primarily the left edge from the viewer's perspective) and in any visible fold shadow lines. Ultramarine's cooler blue-violet deepens the China Blue without shifting hue too dramatically, and the slight violet character of Ultramarine reads as the shadow side of a royal blue fabric under neutral studio light. Leave the absolute frontal highlight of the jersey as a lighter China Blue zone (single layer only — the lighter value comes from reduced pressure rather than a lighter color). Do not burnish the jersey — the slight paper-show-through helps suggest the slight sheen of a synthetic kit fabric.

COLORS

PC1100 China Blue

PC902 Ultramarine

♦ *In blue jersey rendering, the single biggest mistake is applying one flat blue layer — all jersey depth should come from the deliberate cool/warm shift between China Blue (warmer, more royal) and Ultramarine (cooler, deeper). Together they create the optical illusion of fabric volume without any rendering of individual wrinkle lines.*

I2 Step 12 — Collar Detail: Red Stripe, White Stripe, and Tricolor Construction

V-neck collar — *thetricolorstripesequence(blue,white,red,white,blue)*

Heavy-pressure burnished white stripe; clean-edged Carmine Red band with straightedge guidance; shadow-side collar deepening with Ultramarine over-glaze

Heavy pressure

The France kit collar shows a sequence of stripes: the jersey blue transitions into a white stripe, then a red stripe, then white again at the inner V. Use a freshly sharpened PC938 White to establish both white stripes with heavy burnishing pressure — the white pencil on white paper creates a faintly visible smooth zone that reads as white next to the colored areas. For the red stripe, apply PC926 Carmine Red at heavy pressure in a clean, sharply bordered band — use a straightedge guide if needed given the curved V-neck geometry. The shadow side of the collar receives a second pass of PC902 Ultramarine blending into PC926 at the crease to suggest the stripe curving under in shadow. The inner white of the V should be the lightest zone in the lower half of the composition, drawing the eye as a focal anchor below the face.

COLORS

 PC938 White

 PC926 Carmine Red

 PC902 Ultramarine

◆ *Collar stripe precision is what separates a recognizable kit portrait from a generic blue shirt. If your red stripe wavers even slightly, the whole garment reads as wrong. Trace the stripe boundary lightly with a colorless blender first to create a slight paper indent guide, then fill with Carmine Red — the indent acts as a micro-resist to keep pigment within bounds.*

I3 Step 13 — Gold Stars and Jersey Text

Gold star emblem(s) on lower jersey front (bottom right of visible area)

Sharp-point fine star construction; warm gold optical mix with Yellow Ochre + Goldenrod; guidance; shadow-side collar deepening with Ultramarine over-glaze

Medium to Heavy pressure

Two gold stars are visible in the lower right of the jersey. Apply PC942 Yellow Ochre at medium-heavy pressure to form each five-pointed star using a freshly sharpened tip — draw the star outline with confident strokes rather than attempting to fill-in, as the small scale requires precise point placement. Add PC1034 Goldenrod over the Yellow Ochre to push the gold toward a richer, more saturated warm yellow that reads as embroidered gold thread against the blue fabric. On the shadow side of each star (the lower-left facets), apply a single pass of PC945 Sienna Brown to suggest dimensional embroidery catch-shadow. The stars' color contrast against the deep Ultramarine shadow side of the jersey is the maximum simultaneous contrast point in the lower composition — let it sing without over-blending.

COLORS

PC942 Yellow Ochre

PC1034 Goldenrod

PC945 Sienna Brown

◆ *Embroidered gold on a deep blue jersey creates one of the strongest simultaneous contrast relationships in this image — yellow-gold against ultramarine blue are near-complementaries. Do not soften or blend the star edges into the jersey; the crisp hard edge is precisely what makes them read as raised embroidery rather than printed ink.*

I4 Step 14 — Skin Unification: Optical Mixing Pass and Temperature Refinement

Entire face and neck — global refinement of skin tone transitions and color temperature balance

Unifying optical mixing glaze; selective Colorless Blender burnishing on cheeks and forehead; ambient jersey color reflection on lower jaw/neck

Light pressure

Step back and assess the full face for any zone that reads too warm (orange), too cool (grey), or too patterned. Apply a final light pass of PC1092 Nectar across all midtone zones in gentle circular strokes to unify the warm color temperature. In any zone that reads too orange-raw, glaze a single pass of PC1067 90% Cool Grey at ghost pressure to desaturate without cooling dramatically. Use the Colorless Blender with medium pressure in a small circular motion to smooth any visible stroke direction artifacts in the cheek and forehead areas — do not burnish the entire face, only the zones where blending aids the optical mix. The goal of this step is to make all prior layering cohere into a unified, living skin tone. Add a tiny reflected warm yellow-gold from the jersey onto the lower jaw and upper neck using a feather-light pass of PC942 Yellow Ochre — this ambient color bounce is subtle but critical for tying the face and garment together.

COLORS

PC1092 Nectar

PC1067 90% Cool Grey

PC942 Yellow Ochre

♦ *The ambient color bounce from a bright blue jersey onto the lower face should be extremely subtle — you are not painting blue on the chin, you are painting the absence of warmth there relative to the full light zone. The yellow ochre on the jaw similarly reads more as 'warm light continuing' than as 'gold color'. Trust the subtlety.*

Now it's time to evaluate the result. When you're done, upload your work to claude and use this prompt exactly:

"I followed a colored pencil portrait tutorial and I'd like honest feedback on my result. Here's what I was trying to achieve: [describe the portrait]. Here's what I think went well: [your observation]. Here's what I'm not happy with: [your concern]. Please give me 2–3 specific things to improve, and rate the overall result from 1–10 with a brief result."
